ALEX SHEUNDA

Type of Software

Embedded software

CONTRA, the name of the software is an embedded software with the purpose of enhancing seamless transportation on roads with marred with high traffic snarl ups.

It will come in handy to bring sanity on our roads, corruption and accidents on the road are things that will be dramatically reduced.

Methodology

Waterfall methodology will be my select method as it breaks large complex projects into small modules that can be handled quite easily.

C language will be the preferred language in developing the system as it is a versatile language and can be easily moved as it remains intact.
